

Workshop 10

COMP90051 Machine Learning

Semester 2, 2020

Learning Outcomes

By the end of this workshop you should be able to:

1. write down the factorised joint distribution represented by a directed PGM
2. answer probabilistic queries on simple directed PGMs by variable elimination
3. reason about independence between variables

Q1: Bayes net

- a) Find the factorised joint distribution
- b) Count the number of parameters in the CPTs

Q1: Bayes net

- a) Find the factorised joint distribution
$$p(A, B, C, D, E) = p(E|C, D)p(D|C, B)p(C|A, B)p(A)p(B)$$
- b) Count the number of parameters in the CPTs

Node	# free params
<i>A</i>	$2^0 = 1$
<i>B</i>	$2^0 = 1$
<i>C</i>	$2^2 = 4$
<i>D</i>	$2^2 = 4$
<i>E</i>	$2^2 = 4$
Total	14

Q1: Bayes net

- a) Find the factorised joint distribution
- b) Count the number of parameters in the CPTs

Q1: Bayes net

a) Find the factorised joint distribution

$$p(A, B, C, D) = p(D|A, B, C)p(C|A, B)p(A)p(B)$$

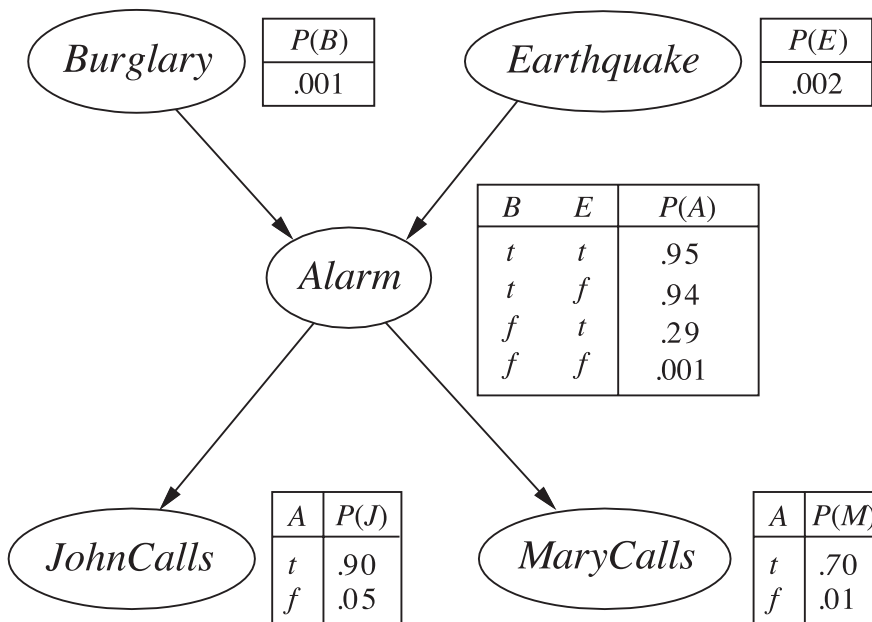

b) Count the number of parameters in the CPTs

Node	# free params
<i>A</i>	$2^0 = 1$
<i>B</i>	$2^0 = 1$
<i>C</i>	$2^2 = 4$
<i>D</i>	$2^3 = 8$
Total	14

Q2: Variable elimination

- Leo's house has an alarm to detect burglars
- The alarm is occasionally set off by an earthquake
- Leo's neighbours John and Mary (who don't know each other) sometimes call if they hear the alarm
- If Leo receives a call from John and Mary, what's the likelihood his house has been burgled?

Q2: Variable elimination

- Query analysis:
 - * Query nodes: *Burglary*
 - * Evidence (observed) nodes: *JohnCalls*, *MaryCalls*
 - * Latent (unobserved) nodes: *Earthquake*, *Alarm*

- Need to compute $p(B|j, m)$

Here lowercase means
the observed value

- Bayes' rule gives

$$p(B|j, m) = \frac{p(B, j, m)}{p(j, m)}$$

- Use the **full joint distribution** + **marginalisation** to compute the numerator and denominator

Q2: Variable elimination

Numerator:

$$p(B, j, m) = \sum_E \sum_A p(A, B, E, j, m) = p(B) \sum_E p(E) \underbrace{\sum_A \overbrace{p(A|B, E) p(j|A) p(m|A)}^{f_{j,m}(A)}}_{f_{j,m}(B, E)}$$

$$f_{j,m}(A) = \begin{array}{c|c} A & f_{j,m}(A) \\ \hline 0 & 0.0005 \\ \hline 1 & 0.63 \end{array} = \begin{array}{c|c} A & p(j|A) \\ \hline 0 & 0.05 \\ \hline 1 & 0.90 \end{array} * \begin{array}{c|c} A & p(m|A) \\ \hline 0 & 0.01 \\ \hline 1 & 0.70 \end{array}$$

$$f_{j,m}(B, E) = \begin{array}{c|c|c} B & E & f_{j,m}(B, E) \\ \hline 0 & 0 & 0.0011295 \\ \hline 0 & 1 & 0.183055 \\ \hline 1 & 0 & 0.59223 \\ \hline 1 & 1 & 0.598525 \end{array} = \begin{array}{c|c|c|c} & & \overbrace{p(A|B, E)} & \\ \hline B & E & A=0 & A=1 \\ \hline 0 & 0 & 0.999 & 0.001 \\ \hline 0 & 1 & 0.71 & 0.29 \\ \hline 1 & 0 & 0.06 & 0.94 \\ \hline 1 & 1 & 0.05 & 0.95 \end{array} \times \begin{array}{c|c} A & f_{j,m}(A) \\ \hline 0 & 0.0005 \\ \hline 1 & 0.63 \end{array}$$

Marginalising over A

Q2: Variable elimination

$$f_{j,m}(B) = \begin{array}{|c|c|} \hline B & f_{j,m}(B) \\ \hline 0 & 0.00149335 \\ \hline 1 & 0.59224259 \\ \hline \end{array} = \begin{array}{|c|c|c|} \hline & \text{E=0} & \text{E=1} \\ \hline B & f_{j,m}(B, E=0) & f_{j,m}(B, E=1) \\ \hline 0 & 0.0011295 & 0.183055 \\ \hline 1 & 0.59223 & 0.598525 \\ \hline \end{array} \times \begin{array}{|c|c|} \hline E & p(E) \\ \hline 0 & 0.998 \\ \hline 1 & 0.002 \\ \hline \end{array}$$

Marginalising over E

$$p(B, j, m) = \begin{array}{|c|c|} \hline B & p(B) \\ \hline 0 & 0.00149186 \\ \hline 1 & 0.00059224 \\ \hline \end{array} = \begin{array}{|c|c|} \hline B & p(B) \\ \hline 0 & 0.999 \\ \hline 1 & 0.001 \\ \hline \end{array} * \begin{array}{|c|c|} \hline B & f_{j,m}(B) \\ \hline 0 & 0.00149335 \\ \hline 1 & 0.59224259 \\ \hline \end{array}$$

Denominator:

$$p(j, m) = \sum_B p(B, j, m) = 0.00149186 + 0.00059224 = 0.002084100239$$

Putting the results together:

$$p(B = 1 | j, m) = \frac{p(B = 1, j, m)}{p(j, m)} = \frac{0.00059224}{0.002084100239} = 0.28417184$$

Q3: Independence

Returning to the previous Bayes net:

- a) If no evidence is observed, are the *Burglary* and *Earthquake* nodes independent?
- b) What if we observe *Alarm* = t?
- c) Explain your answer to (b) intuitively.

Q3: Independence

a) Check for (marginal) independence:

$$p(B, E) = p(B)p(E) \underbrace{\sum_A p(A|B, E) \underbrace{\sum_J p(J|A)}_{=1} \underbrace{\sum_M p(M|A)}_{=1}}_{=1}$$
$$= p(B)p(E)$$

b) Check for (conditional) independence when we observe $a = t$:

$$p(B, E|a) \propto p(B)p(E)p(a|B, E) \underbrace{\sum_J p(J|a)}_{=1} \underbrace{\sum_M p(M|a)}_{=1}$$
$$\neq p(B|a)p(E|a)$$

Hint: see supplemental slides 'Independence in PGMs' for graphical rules

Q3: Independence

c) Why are B and E dependent given $a = t$?

- * The sub-graph consisting of B , E , A is known as a *common effect* structure (a.k.a. v-structure)
- * Observing the effect (*Alarm*) puts the *Burglar* and *Earthquake* in competition as an explanation for the effect
- * In other words, we expect B and E to be anti-correlated given $a = t$
- * This is indeed the case—e.g.
 $p(B = t | e = t, a = t) = 0.003$ and
 $p(E = t | b = t, a = t) = 0.002$
